

the 1990s, the number of people with a disability in the United States has increased by 25% (U.S. Census Bureau 2000). The number of people with a disability in the United States is expected to increase to 35% by the year 2020 (U.S. Census Bureau 2000).

As the number of people with a disability increases, the need for accessible information and communication technologies (ICT) increases. The purpose of this study was to investigate the usability of a web browser for people with a visual impairment. The study was conducted to determine the usability of a web browser for people with a visual impairment and to identify the usability problems that people with a visual impairment experience when using a web browser.

The study was conducted using a user-centred design approach. The user-centred design approach is a design process that focuses on the needs and requirements of the users. The user-centred design approach involves the following steps: (1) understanding and specifying the requirements of the users, (2) producing design solutions that meet those requirements, and (3) evaluating those design solutions against the requirements of the users.
